The Dutch man known as Sol12, has spent 11 months investigating the claims that this crop circle was made by a team of 50/52/55/60/100 people organised by businessman Remco Delfgauw, who also claimed to be a crop circle artist. Since there has been no proof provided, but many unsubstantiated claims, it must be concluded that at least this crop circle is not made by the only group of humans who attempted to take the credit for this magnificent and historic Human Butterfly Crop Circle. The following threads at the internet discussion forum document the twists and turns associated with this affair. Most importantly, the magnificent detective work by Sol12, should be appreciated by people interesting in establishing what did or did not happen, with additional links to information available at other websites and videos place on the YouTube website.

[http://www.joyfirepublishing.com/Joyfire\\_Extreme\\_Spaceweather.php](http://www.joyfirepublishing.com/Joyfire_Extreme_Spaceweather.php)
- ◆ Geosynchronous orbit is at about 36000 kilometers or 22320 miles, that's about 5.5 Earth radii. ( $R_E$ ), directly above the equator. Also, the magnetopause -- the boundary between Earth's magnetic field (magnetosphere) and the surrounding plasma -- is usually cited as being at 10-12 Earth radii but this varies dependent on the speed of the solar wind or solar activity. If you look at the diagram on page 27 of the essay *The Greatest Transition*, the magnetosheath/magnetopause is under pressure and is colour coded red, but the scale means that it can become "white-hot". The black disk with a dot is the location of Earth. On 7<sup>th</sup> July 2009, the magnetosheath/magnetopause was punched so hard that the whole boundary moved half way back to Earth where we place the satellites in geostationary or geosynchronous orbit (the definitions are not the same, see the [www.ehow.com](http://www.ehow.com) reference below). At the famous Space Weather 'Bastille Day' event in 2001, the magnetopause moved as close as  $4.9R_E$  to Earth and left 3 geosynchronous GOES satellites exposed in the magnetosheath, a dynamic region of turbulent plasma flow that acts a barrier to the plasma in the surrounding solar system. Now, the YouTube video referenced below shows the magnetopause position & 3-day history of magnetopause standoff & cross cap ionospheric potential difference. It also shows that around the 7/7/2009 the magnetopause was actually varying from  $9.5 - 14.5R_E$  and that it was pushed back to about  $5R_E$  which according to space weather researchers is about the limit that it can go.

- ◆ The Correias write: "So-called 'extra dimensions' are thought of as nothing more than a matter of ad hoc additions in imaginary topological spaces - and yet, in physical nature, they can only come about as a function of an energy superimposition process, as a phase energy process. But since 'supersymmetrists' are unable to think in terms of energy, dimensions can arbitrarily be added at will - with new dimensionalities aimlessly sprinkled around as the baffling new properties of quarks..."
